

Path to EHR Access for Use in Community Pharmacy Practice

Some health information managers from health systems in Wisconsin are unaware of the **value in providing EHR access to community pharmacists outside of the health system**. Here is a plan for helping community pharmacists gain access to the EHR.

Develop

EHR Access & Use

1 What problems are a health system/provider group facing?

Identify something that is of value to the health system. Examples might focus on improving quality metrics and/or improving the value of care.

2 How can you solve these problems?

- How will access to the EHR add value (improve the problem)?
- Who can you partner with as an opinion leader?

3 Familiarize Yourself

- ✓ **With the EHR** - How do you use the EHR? What data do you need?
- ✓ **With privacy policies** within the health system and your work system.
- ✓ **With apps** that enable EHR access.
- ✓ **With the e-care plan** (scan QR code for more).

4 Communicate Solution to the Health System

Be aware of health system concerns and develop strategies address them. Then, communicate these strategies to the health system by leveraging your opinion leaders.

5 Evaluate & Improve EHR Access & Use

Determine how to incorporate EHR access into pharmacy dispensing workflow. Access will not be integrated into dispensing software.

6 Evaluate e-care Plan Use

- How will you incorporate use of the e-care plan into your workflow?
- How will the e-care plan be incorporated into the EHR?

Pharmacist eCare Plan

7 Network with other EHR-using Pharmacists

Communicate with other pharmacists who have access to and use an EHR. Establish a community to share success, failures, and best practices.
